Title Rate of Root Resorption in Maxillary Central Incisors

Institution Department of Orthodontics
University of Connecticut
Farmington, Ct. 06001

Summary

This prospective study determined the amount and rate of root resorption of 82 maxillary central incisors during the first twelve months of orthodontic therapy. The results showed that resorption begins early in treatment and linearly progresses for those susceptible. No relationship was demonstrated between any pretreatment /treatment variable and root resorption.
